VPN Configuration for Mac OS X

VPN Services are used off-campus when you need to connect to on-campus resources.

Click on the **Apple Menu** (top-left corner of screen), and select **System Preferences**.

Under **Internet & Wireless**, select **Network**.

At the lower-right corner of the screen, click the “+” symbol to add a connection, and fill out the fields as shown in the picture.

When finished, click **Create**.
Next, fill out the VPN properties screen as shown, entering your netID for account name.

After that, click on Authentication Settings, and select Password for the authentication type.

You are now ready to connect. Click on the VPN Toolbar icon (circled), and select Connect. When prompted, enter your netID and password.

If you see a timer appear next to the icon after typing in your login information, you are connected. To disconnect, click on the icon, and select Disconnect.
